***MEDICINES, VITAMINS & HERBAL SUPPLEMENTS TO AVOID
 BEFORE AND AFTER YOUR UPCOMING SURGERY***

BLEEDING is a natural consequence of surgery. However, certain medicines and dietary supplements can make bleeding more bothersome. Excessive bleeding can increase the risks of the surgical procedure, affect wound healing, and make your recovery from surgery slower. Additionally, smoking and exposure to second hand smoke can delay wound healing because nicotine makes small blood vessels shrink. This makes it harder for blood vessels to bring nutrients to help your tissues recover after surgery. Thus you should stop your exposure to nicotine smoke peri-operatively, as well as the medicines and herbals listed below. Please stop these for the appropriate length of time listed in advance of your upcoming surgery. Do not resume any of these post-operatively until you are cleared to do so by your surgeon. **If you have been prescribed blood thinners by another physician please notify them of your plans for surgery and the need to minimize their use before discontinuing them.**

Aspirin containing products:			stop 7 days before surgery
Alka Seltzer	Buffaprin	Empirin	Pepto Bismol
